

Top Security Features:

- Logoff from OWA Required if a user wishes to browse to another page.
- Prevents Unauthorized Individuals from accessing corporate information, simply by hitting the 'back' button or typing a URL.
- Works closely with other perimeter-based security products such as ISA and RSA two factor authentication to provide a complete security solution.
- Custom Security Polices can be configured by the Administrator to apply different security policies based on criteria such as logon ID or Security Group membership, IP address and Corporate Device Recognition.

Messageware NavGuard Exchange 2019

Prevents Unauthorized Access to OWA Accounts

NavGuard protects confidential data and OWA sessions from exposure when users leave an active session to browse other sites.

NavGuard monitors OWA usage and identifies when a user is creating a security vulnerability by navigating away from an active OWA session without first logging off. In a public environment or on a shared computer where the original user inadvertently leaves their OWA session active, the next user on that computer will have unauthorized access to that OWA session without being required to re-authenticate. Even with ISA Server or RSA installed, this security vulnerability exists.

NavGuard's user-friendly prompt alerts the user that a security event is about to occur and offers the user the option of logging off before continuing to another page or returning to the active OWA session. In this way, NavGuard prevents users from creating a security exposure by leaving their OWA session active.

NavGuard protects against unauthorized access and extends the security provided by forms based authentication (FBA) and 3rd party security products with customizable security policies for OWA to offer greater protection for OWA users.
